

The exam assignment will consist of two parts which will be digitally available.

Part 1/2: *A traditional assignment with questions related to a database.*

This part contains three files you should download:

1. A `.pdf` file containing the questions you should answer.
2. A `.sql` file containing the SQL statements to create the database, tables, and data, such that you have the same relation instances shown in the `.pdf` file. This is very helpful for answering the questions correctly, e.g., by running your SQL statements.
Important note: Referential constraints are deliberately omitted, you have to add them yourself, if you want the database to be consistent.
3. A `answers.sql` file that you must complete with your answers to the questions in the `.pdf` file.

The `answers.sql` file must be filled according to the following instructions. If you do not follow these instructions, some of your answers might not be counted, as we use a tool to automatically evaluate your SQL code.

- You must not delete or alter the text which is already present in the file. You should only ever add text.
- Add your student ID where it is requested (see top of the file):
-- In next line, insert your student ID after the colon.
-- Student ID: **write your student ID here**
- For each question insert a single SQL statement that is your answer. If you write multiple answers for a single question, none will be counted for this question.
- Your answer to question **x** must follow the three lines looking similar to this

-- qx: Answer to question **X** MUST follow below. (don't edit this line)

write your answer to question x here
- Do not add `USE` or `DROP` commands to `answers.sql`.
- Feel free to write comments for your answers. Comments must be placed after two hyphens and must not contain line breaks, e.g., -- a comment
- It is important that the names of tables, attributes, function, etc. in your answers are the same as stated in the questions `.pdf` file. Ideally, you test your answers against the provided database. Any statements that do not work (compile), will not reward points.

When you have completed the file `answers.sql` you **have to hand it in digitally**. Only hand in `answers.sql` and **no other files**.

Part 2/2: *A multiple-choice assignment testing your design and theory skills.*

This part is taken directly on the platform, i.e., it is filled and handed in electronically.

Important remarks:

- There is only ever one correct choice / answer per question. If two options seem correct, pick the one that is more correct, that is follows the rules and theory we learned during the lectures.
- You can only ever choose one answer.
- A correct answer scores positive points.
- An incorrect answer does not score negative points, that is, it gives zero score.
- The order of questions and answers / choices might be randomized from student to student.

When you have logged in as a student on <https://eksamen.dtu.dk>, you should find **two entries** for course 02170, one for each part. It would look similar to the screenshot below:

☐ 02170 02170 Database systems (1/2)	216 Registrations	Exam has not been made visible	Examiners Anne Elisabeth Haxthausen Exam administrators Anne Elisabeth Haxthausen
☐ 02170 02170 Database systems (2/2)	216 Registrations	Exam has not been made visible	Examiners Anne Elisabeth Haxthausen Exam administrators Anne Elisabeth Haxthausen

The red text *Exam has not been made visible* will be replaced with green text saying *Exam has been made visible*, when you take the exam.
